

CLOUDTRACKER

VIDEO TRANSCRIPT

As the federal government takes bold action to harness the power of cloud, you're faced with the complexity of managing costs and getting the best performance across all your environments.

Spreadsheets and dashboards might seem like viable solutions to keep it under control. Then you quickly discover you're stuck managing dozens of spreadsheets and clusters of dashboards with weeks-old data and siloed information — instead of making agile financial decisions and focusing on the mission.

Fortunately, the solution exists: CloudTracker™.

CloudTracker simplifies your cloud operations. It's a powerful, intuitive application that provides crystal clear transparency into your cloud costs and use.

For years, CloudTracker has delivered a FINOPS capability providing federal clients a single pane of glass to get more from their cloud investments, deliver valuable insights, and reduce risk.

CloudTracker empowers users across the federal government — from cloud engineers to senior leaders — to save money and time and deliver more value.

Because it seamlessly works across your cloud providers, CloudTracker provides an aggregated, real-time view of your cloud operations in a multi or poly-cloud environment — in every individual tenant account, and across your entire enterprise.

Unlike other tools, CloudTracker is built for the government and owned by the government. CloudTracker has been specifically designed for use in your world.

The highest security standards for the U.S. government have been built into CloudTracker from day one. This allows you to control access on a granular level. You can limit the view of a single environment to one team or enable secure information sharing between several organizations.

It provides flexibility with customized FINOPS dashboards to track and share the data that matters to you — from billing information and monthly spend by service and geography, to usage trends and migration progress.

It's time to place confident decision-making back in your hands. Put the power of CloudTracker to work and propel your mission success.
